Wireless mouse not working on google chromebook

A wireless Logitech mouse compatible with the Logitech Unifying Receiver can connect to any Unifying Receiver. You'll need Logitech's Unifying software to pair or un-pair a compatible wireless mouse. Mice not compatible with the Unifying Receiver only connect to the receiver they shipped with or Bluetooth. This article includes instructions for syncing a Logitech wireless mouse with a different receiver and information about using Unifying- and Non-Unifying Receivers. There is also information on disconnecting a mouse from a wireless receiver. You can use any wireless Logitech mouse that supports the Unifying Receiver with any Unifying Receiver. A single Unifying Receiver can connect up to six wireless Logitech devices, including mice and keyboards. Most wireless Logitech mice connect through a USB dongle called the Logitech Unifying Receiver. Your mouse will ship with a receiver, but you can sync the mouse to a different receiver if you lose it. Download Logitech's Unifying software. It's available for Windows 10, 8, and 7, macOS/OS X 10.8 or newer, and ChromeOS. Remove any Logitech Unifying Receiver currently connected to your PC. Launch the Logitech Unifying app. A welcome screen will appear. Tap Next. The installer will prompt you to connect a Logitech Unifying Receiver to your computer. Connect it to an open USB port. Tap Next. The next screen instructs you to turn your wireless mouse off and then back on. Do so and click Next. The Logitech Unifying Receiver may not detect your wireless Logitech mouse during this step if it's currently connected to your computer over Bluetooth. Disconnect it from Bluetooth to resolve this problem. Your mouse should now be connected. The final screen will ask you to confirm your mouse pointer is working. Select the Yes radio button and then click Exit. You can use the Logitech Unifying software to unpair devices, as well. Here's how to do it. Launch the Logitech Unifying software. Click Advanced. A screen will appear with a list of currently connected Unifying devices. Click the device you want to unpair and then tap Un-pair. FAQ How do I replace the receiver for a wireless mouse? How do I connect a Logitech wireless mouse without a receiver? If your Logitech wireless mouse supports Bluetooth, you can connect it via Bluetooth instead of a receiver. To do this on a Windows 10 PC, go to Settings > Devices > Add Bluetooth. On your mouse, press the Connect button; the device should appear as an available Bluetooth device on your screen. Select it to complete the pairing process and use your mouse. Can I fix my Logitech wireless mouse receiver? Possibly. First, update your Unifying Receiver if necessary. Then try uninstalling and reinstalling the software, then sync your mouse to the receiver. Check if you have the correct USB drivers installed on your PC. Search for the USB.inf and USB.PNF files. Uninstall any applications interfering with your receiver, such as software used to connect gaming controllers. If all else fails, replacing your wireless receiver is easy and relatively inexpensive. Do all wireless Logitech mice support the unifying receiver? No. For example, Logitech's gaming mice don't support the Unifying Receiver and instead use Logitech's "Lightspeed" wireless feature. You can identify wireless Logitech mice compatible with Unifying by the square, sun-like icon printed on the mouse. This icon is also on the Unifying Receiver. How do I pair my Logitech mouse or keyboard with another non-unifying receiver? Wireless Logitech mice and keyboards that connect to a Unifying Receiver can't connect to other receivers, including those made by Logitech. However, some wireless devices compatible with the Unifying Receiver also support Bluetooth. Thanks for letting us know! Tell us why! Welcome!! Thank you for downloading AndroMouse 8.0. This is the place where you learn how to setup AndroMouse, download AndroMouse Server, ask questions and help others. Some of the screenshots I used for version 8.0 are from previous version, please note that the functionality is still the same even if says older version in the screenshots. AndroMouse lets you convert your Android smartphone into a wireless mouse, keyboard, media remote, file browser and much more. Communication with your computer can be made using your WiFi network or using Bluetooth. AndroMouse features most mouse functionalities including click, double-click, drag and drop, scroll and right-click. You can use your phone's on-screen keyboard as the wireless keyboard. In addition to wireless mouse and keyboard, AndroMouse also provides tons of extra features. Most popular features include speak-to-type and file-browser. Relax on your couch and search Google or Youtube with your voice. Compose an email with your voice instead of using your physical keyboard!! Browse your computer files on your phone. Here is a sneak peek of what's new in all new AndroMouse 8.0. What has changed since earlier versions? Basically everything! I published the first version of AndroMouse in 2011 - since then I had been updating/fixing few things here and there without changing much of the core functionalities. To make the application and the server much more robust and to boost performance, I rewrote them again from scratch. Although everything underneath the application is brand new, the basic motivation of my hard work remains unchanged - to make the best performing wireless mouse and keyboard app. If you are familiar with earlier versions of AndroMouse, it should be fairly simple to get started. Getting Started Connecting to the AndroMouse Server If you have not downloaded AndroMouse in your phone yet, download it from the Play Store - AndroMouse Free AndroMouse - No Ads To use AndroMouse, you will need to download the AndroMouse Server and run it on the computer that you want to wirelessly control. AndroMouse server runs on Windows, Mac or Linux and requires no further installation. Please download AndroMouse Server from the link below: Download AndroMouse Server: Please make sure that your app version and server version matches - current version is AndroMouse 6.3 (both app and the server). The downloaded zip file contains a readme text file and AndroMouse Server.jar file. The AndroMouse Server.jar file is a light-weight java executable file, to run it please make sure that you have java runtime installed on your computer. Most computers already come with Java runtime but if yours didn't - just download it from the java website and install it. Link to instructions on how to check if you have java installed on your computer is provided below: How to check if you have java installed When you have made sure that Java runtime is installed, double click on the AndroMouse Server.jar file that you have just extracted and just like that the AndroMouse Server is running. Now we can use AndroMouse app on your phone to make a connection. Linux users - When trying to run the server you might get an error message with something like ' . the file is not marked as executable'. To fix this, right-click on the file and click on properties and on Permissions tab - make sure to check box 'Allow executing file as program' is selected. Mac Users - When trying to run the server for the first time you might get a message saying 'the file cannot be opened because it is from an unidentified developer'. In that case, right-click on the server file and click on open. Windows Users - You might get a Windows security alert saying something like 'Windows Firewall has blocked some features.'. You must select 'Allow Access' to use AndroMouse. If you are still having issues connecting to the server, your AntiVirus software might be blocking connections - please open Java SE binary for incoming and outgoing connections on your Firewall settings. You will see the following screen when you successfully start the AndroMouse server. Now all you have to do is let it run and use your AndroMouse app in your phone to setup the connection. Connecting Using WiFi Note - Screenshots provided below are from the ad-free version. AndroMouse home - To start a connection click on the new icon AndroMouse - new connection screen Click on the 'new' icon located on the title bar of the application. You will see the following screen that will let you choose either WiFi or Bluetooth (Bluetooth is only available on Windows for the time being). Select Wifi. Note - Please make sure that the computer and the Android device are connected to same the wifi network or hotspot. AndroMouse will automatically start detecting AndroMouse Server that is running on your computer connected to your wifi network, once found it will provide the server details and give you the option to start the connection. However, for some reason, if the app didn't detect the server - you also have the option to enter the Server's IP address manually to make the connection. AndroMouse automatically detects the Server When server is found, select Connect to begin Connecting Using Bluetooth Note - Please make sure that your phone is paired with the computer and Bluetooth is turned on. From the 'New Connection' screen - select Bluetooth. You will see a list of Bluetooth devices paired with your phone under 'Paired Devices'. Select your computer to make the connection. Connecting with Bluetooth Green line under title indicates connected state After successful connection - you will notice that the thin horizontal bar below title bar turns green. Note - the color of the thin horizontal bar beneath the title bar indicates connection status - red for disconnected and green for connected. You will also feel a short vibration when your active connection gets disconnected. Using Wireless Mouse Move your single finger around the touchpad area as you would move a physical mouse over a mousepad. You can tap on the touchpad to send a click signal or use the mouse buttons below the touchpad to send respective click signals to your computer. Here is the list of various ways you can send signals using the touchpad, scroll bar and the mouse buttons. Click Tap on touchpad with single finger or left click button Double click Double tap on touchpad Right click Tap on touchpad with two fingers or right click button Drag and drop Tap and hold on touchpad for two seconds-move finger to drag-tap to release Scroll Swipe up or down on the scrollbar Using Wireless Keyboard Tap on the 'keyboard icon' to bring up keyboard. Press on back soft-button to hide the keyboard. AndroMouse uses your phone's standard keyboard AndroMouse Extras AndroMouse Extras I have provided screenshot of each of the AndroMouse Extras and a short description underneath. If you feel like speaking instead of typing - use this feature. All your function keys and additional keyboard keys are provided here. Numpad Use game pad to use your phone as a wireless joystick. You can customize each button so that you can select what key you want to send when you click on that button. Use pre-existing shortcuts like copy, paste, print or create your own. Remote to control the media player running on your computer. It also comes with mini file browser so you can browse your computer's media files and select which ones to play. Browse your computer's files from your phone, you can also send the signal to open the file in your computer from your phone. Control your Powerpoint presentation from your phone. You will also see your computer's screen to make sure that you are on right slide (this function is currently in beta). Restart, shutdown, lock and put your computer to sleep from this remote. Settings Many of the AndroMouse features are customizable via the settings screen. If you have a specific question on any of the setting item, please let me know in the comments below. Thank You!! I know there are a lot of things that I have not covered on this page, but should you have any question, comment or any suggestion for the future release, please let me know in the comments section. Thank you once again for downloading AndroMouse. I hope you will enjoy the app and give me a positive review in the app store. Link to the app store. AndroMouse Free AndroMouse - No Ads
